SUBJECT: Memorandum Report: *Comparison of Second-Quarter 2010 Average Sales Prices and Average Manufacturer Prices: Impact on Medicare Reimbursement for Fourth Quarter 2010*, OEI-03-11-00030

This review was conducted in accordance with the statutory mandate for the Office of Inspector General (OIG) to compare average sales prices (ASP) and average manufacturer prices (AMP) for Medicare Part B prescription drugs and identify ASPs that exceed AMPs by at least 5 percent. The review also estimated the financial impact of lowering reimbursement amounts for drugs that exceeded the 5-percent threshold to 103 percent of the AMP, pursuant to statute.

**SUMMARY**

Since the advent of the ASP reimbursement methodology, OIG has issued 18 reports comparing ASPs to AMPs. This latest pricing comparison examines drugs that exceeded the 5-percent threshold based on either complete or partial AMP data in the second quarter of 2010. Of the 350 drug codes with complete AMP data in that quarter, 10 exceeded the 5-percent threshold. Over half of the 10 codes were also eligible for price reduction in at least one of the three previous quarters. If reimbursement amounts for all 10 codes with complete AMP data had been based on 103 percent of the AMPs during the fourth quarter of 2010, we estimate that Medicare and its beneficiaries would have saved over $700,000 in that quarter alone. Of the 106 drug codes with only partial AMP data in the second quarter of 2010, 15 had ASPs that exceeded the AMPs by at least 5 percent. Although CMS has expressed concern that partial AMP data may not adequately reflect market trends, we found that pricing comparisons for 5 of the 15 codes seemed to accurately capture underlying market trends even though AMP data were missing for some of the associated drug products. Therefore, price reductions may be appropriate in these five cases. We could not perform pricing comparisons for an additional 54 drug codes because none of the drug products used to establish Medicare reimbursement had corresponding AMP data. Manufacturers for 16 percent of those drug products had Medicaid drug rebate agreements and were therefore generally required to submit AMPs.
BACKGROUND

The Social Security Act (the Act) mandates that OIG compare ASPs to AMPs. If OIG finds that the ASP for a drug exceeds the AMP by a certain percentage (currently 5 percent), section 1847A(d)(3)(A) of the Act states that the Secretary of Health & Human Services (the Secretary) may disregard the ASP for the drug when setting reimbursement amounts. Section 1847A(d)(3)(C) of the Act further states that “… the Inspector General shall inform the Secretary (at such times as the Secretary may specify to carry out this subparagraph) and the Secretary shall, effective as of the next quarter, substitute for the amount of payment … the lesser of (i) the widely available market price … (if any); or (ii) 103 percent of the average manufacturer price….”

Medicare Part B Coverage of Prescription Drugs
Medicare Part B covers only a limited number of outpatient prescription drugs. Covered drugs include injectable drugs administered by a physician; certain self-administered drugs, such as oral anticancer drugs and immunosuppressive drugs; drugs used in conjunction with durable medical equipment; and some vaccines.

Medicare Part B Payments for Prescription Drugs
The Centers for Medicare & Medicaid Services (CMS) contracts with private companies, known as Medicare Administrative Contractors (MAC), to process and pay Medicare Part B claims, including those for prescription drugs. To obtain reimbursement for covered outpatient prescription drugs, health care providers submit claims to their MACs using procedure codes. CMS established the Healthcare Common Procedure Coding System (HCPCS) to provide a standardized coding system for describing the specific items and services provided in the delivery of health care. In the case of prescription drugs, each HCPCS code defines the drug name and the amount of the drug represented by the HCPCS code but does not specify manufacturer or package size information.

Medicare and its beneficiaries spent over $11 billion for Part B drugs in 2009. Although Medicare paid for nearly 800 outpatient prescription drug HCPCS codes that year, most of the spending for Part B drugs was concentrated on a relatively small subset of those codes. In 2009, 64 HCPCS codes accounted for 90 percent of the expenditures for Part B drugs, with only 13 of these codes representing the majority (52 percent) of total Part B drug expenditures.

---

1 Section 1847A(d)(2)(B) of the Act.
2 Section 1847A(d)(3)(B)(ii) of the Act provides the Secretary with authority to adjust the applicable threshold percentage in 2006 and subsequent years; however, the threshold percentage has been maintained at 5 percent.
3 Medicare expenditures for Part B drugs in 2009 were calculated using CMS’s Part B Analytics and Reports (PBAR). The PBAR data for 2009 were downloaded in March 2010.
Reimbursement Methodology for Part B Drugs and Biologicals
Medicare Part B pays for most covered drugs using a reimbursement methodology based on ASPs.4 As defined by law, an ASP is a manufacturer’s sales of a drug to all purchasers in the United States in a calendar quarter divided by the total number of units of the drug sold by the manufacturer in that same quarter.5 The ASP is net of any price concessions, such as volume discounts, prompt pay discounts, cash discounts, free goods contingent on purchase requirements, chargebacks, and rebates other than those obtained through the Medicaid drug rebate program.6 Sales that are nominal in amount are exempted from the ASP calculation, as are sales excluded from the determination of “best price” in Medicaid’s drug rebate program.7, 8

Manufacturers that participate in the Medicaid drug rebate program must provide CMS with the ASP and volume of sales for each of their national drug codes (NDC) on a quarterly basis, with submissions due 30 days after the close of each quarter.9 An NDC is an 11-digit identifier that represents a specific manufacturer, product, and package size.

Because Medicare Part B reimbursement for outpatient drugs is based on HCPCS codes rather than NDCs and more than one NDC may meet the definition of a particular HCPCS code, CMS has developed a file that “crosswalks” manufacturers’ NDCs to HCPCS codes. CMS uses information in this crosswalk file to calculate volume-weighted ASPs for covered HCPCS codes.

Calculation of Volume-Weighted ASPs
Fourth-quarter 2010 Medicare payments for most covered drug codes were based on second-quarter 2010 ASP submissions from manufacturers, which were volume-weighted using an equation that involves the following variables: the ASP for the 11-digit NDC as reported by the manufacturer, the volume of sales for the NDC as reported by the manufacturer, and the number of billing units in the NDC as determined by CMS.10 The amount of the drug contained in an NDC may differ from the amount of the drug specified by the HCPCS code that providers use to bill Medicare. Therefore, the number of billing units in an NDC describes the number of HCPCS code units that are in that NDC. For instance, an NDC may contain a total of 10 milliliters of Drug A, but the corresponding HCPCS code may be defined as only 5 milliliters of Drug A. In this case, there are two billing units in the NDC. CMS calculates the number of billing units in each NDC when developing its crosswalk files.

---

4 Several Part B drugs, including certain vaccines and blood products, are not paid for under the ASP methodology.
5 Section 1847A(c) of the Act, as added by the Medicare Prescription Drug, Improvement, and Modernization Act of 2003, P.L. 108-173.
6 Section 1847A(c)(3) of the Act.
7 Section 1847A(c)(2) of the Act.
8 Pursuant to section 1927(c)(1)(C)(i) of the Act, “best price” is the lowest price available from the manufacturer during the rebate period to any wholesaler, retailer, provider, health maintenance organization, nonprofit entity, or governmental entity within the United States, with certain exceptions.
9 Section 1927(b)(3) of the Act.
10 The equation that CMS currently uses to calculate volume-weighted ASPs is described in section 1847A(b)(6) of the Act. It is also provided in Appendix A.
Under the ASP pricing methodology, the Medicare allowance for most Part B drugs is equal to 106 percent of the volume-weighted ASP for the HCPCS code. Medicare beneficiaries are generally responsible for 20 percent of this amount in the form of coinsurance.

The Medicaid Drug Rebate Program and AMPs
For Federal payment to be available for covered outpatient drugs provided under Medicaid, the Act mandates that drug manufacturers enter into rebate agreements with the Secretary and pay quarterly rebates to State Medicaid agencies. Under these rebate agreements and pursuant to the Act, manufacturers must provide CMS with the AMPs for each of their NDCs. As further explained in regulation, manufacturers are required to submit AMPs within 30 days after the end of each month and each quarter.

During the second quarter of 2010, the AMP was generally defined by statute to be the average price paid to the manufacturer for the drug in the United States by wholesalers for drugs distributed to the retail pharmacy class of trade. The AMP is generally calculated as a weighted average of prices for all of a manufacturer’s package sizes of a drug and is reported for the lowest identifiable quantity of the drug (e.g., 1 milliliter, 1 tablet, 1 capsule).

Penalties for Failure To Report Timely Drug Pricing Data
Under the law, manufacturers that fail to provide ASP and AMP data on a timely basis may be subject to civil money penalties and/or termination from the drug rebate program. Accordingly, CMS has terminated rebate agreements with a number of manufacturers for failure to report AMPs and, for the purposes of evaluating potential civil money penalties, has referred to OIG manufacturers that failed to submit timely AMPs. At the time of our review, no manufacturers had been terminated or formally referred to OIG for failure to report timely ASPs. In September 2010, OIG announced a new enforcement initiative under which OIG would begin imposing civil money penalties on manufacturers that failed to report timely ASPs and/or AMPs.

---

11 Sections 1927(a)(1) and (b)(1) of the Act.
12 Section 1927(b)(3) of the Act.
13 42 CFR § 447.510.
14 Section 1927(k)(1) of the Act.
15 Effective October 2010, section 2503 of the Patient Protection and Affordable Care Act (Affordable Care Act), P.L. 111-148, changes the definition of AMP in a way that is not relevant for the purposes of this report. However, it may affect pricing comparisons between ASPs and AMPs for the fourth quarter of 2010 and beyond.
16 During the second quarter of 2010, 42 CFR § 447.504(i) specified that a quarterly AMP should be calculated as a weighted average of monthly AMPs in the quarter.
17 Sections 1927(b)(3)(C)(i) and (4)(B)(i) of the Act.
18 The Secretary delegated to OIG the responsibility to impose civil money penalties for violations of section 1927(b)(3)(C) of the Act in 59 Fed. Reg. 52967 (Oct. 20, 1994).
19 CMS began referring noncompliant manufacturers to OIG in response to a 2005 report entitled Deficiencies in the Oversight of the 340B Drug Pricing Program (OEI-05-02-00072). As part of this report, OIG recommended that CMS consider referring manufacturers whose pricing data submissions do not comply with reporting requirements to OIG so that penalties could be imposed in appropriate cases.
Office of Inspector General’s Monitoring of ASPs and AMPS
In accordance with its statutory mandate, OIG has issued 16 quarterly pricing comparisons since the ASP reimbursement methodology for Part B drugs was implemented in January 2005. In addition, OIG has completed two annual overviews of ASPs and AMPs, which examined data across all four quarters of 2007 and 2008, respectively. A list of all 18 reports is provided in Appendix B.

Although OIG has consistently recommended that CMS develop a price substitution policy and subsequently lower reimbursement for drugs that exceed the 5-percent threshold, no price substitutions have been made to date. In July 2010, CMS published a proposed rule that, among other things, specified the circumstances under which AMP-based price substitutions would occur. However, the agency has opted not to finalize the price substitution policy from the proposed rule, thereby suspending any plans to lower reimbursement amounts based on the results of OIG’s pricing comparisons.

METHODOLOGY

We obtained a file from CMS containing NDC-level ASP data from the second quarter of 2010, which were used to establish Part B drug reimbursement for the fourth quarter of 2010. This file also includes information that crosswalks NDCs to their corresponding HCPCS codes. Both the ASP data and the crosswalk data were current as of September 27, 2010. We also obtained AMP data from CMS for the second quarter of 2010, which were current as of August 3, 2010.

Analyzing ASP Data From the Second Quarter of 2010
As mentioned previously, Medicare does not base reimbursement for covered drugs on NDCs; instead, it uses HCPCS codes. Therefore, CMS uses ASP information submitted by manufacturers for each NDC to calculate a volume-weighted ASP for each covered HCPCS code. When calculating these volume-weighted ASPs, CMS includes only NDCs with ASP submissions that are deemed valid.

As of October 2010, CMS had established prices for 519 HCPCS codes based on the ASP reimbursement methodology mandated by section 1847A(b)(6) of the Act. Reimbursement amounts for the 519 HCPCS codes were based on ASP data for 3,001 NDCs.

Analyzing AMP Data From the Second Quarter of 2010
To ensure that the broadest range of drug codes is subject to OIG’s pricing comparisons, we divided HCPCS codes into the following three groups:

---

22 CMS cited a number of factors in support of its decision not to finalize the price substitution policy, including an ongoing preliminary injunction issued on December 19, 2007, by the United States District Court for the District of Columbia, as well as upcoming regulations that will implement changes to the definition of AMP pursuant to section 2503 of the Affordable Care Act. On December 14, 2010, the preliminary injunction was vacated.
(1) **HCPCS codes with complete AMP data**—i.e., HCPCS codes with AMP data for every NDC that CMS used in its calculation of volume-weighted ASPs;

(2) **HCPCS codes with partial AMP data**—i.e., HCPCS codes with AMP data for only some of the NDCs that CMS used in its calculation of volume-weighted ASPs; and

(3) **HCPCS codes with no AMP data**—i.e., HCPCS codes with no AMP data for any of the NDCs that CMS used in its calculation of volume-weighted ASPs.

As previously noted, the AMP for each NDC is reported for the lowest identifiable quantity of the drug contained in that NDC (e.g., 1 milliliter, 1 tablet, 1 capsule). In contrast, the ASP is reported for the entire amount of the drug contained in the NDC (e.g., 50 milliliters, 100 tablets). To ensure that the AMP would be comparable to the ASP, it was necessary to convert the AMP for each NDC so that it represented the total amount of the drug contained in that NDC.

To calculate “converted AMPs” for NDCs in the first and second groups, we multiplied the AMP by the total amount of the drug contained in each NDC, as identified by sources such as the CMS crosswalk file, manufacturer Web sites, Thomson Reuters’ *Red Book*, and the Food and Drug Administration’s NDC directory. For certain NDCs, we were unable to successfully identify the amount of the drug reflected by the ASP and therefore could not calculate a converted AMP. Because of these unsuccessful AMP conversions, a total of nine HCPCS codes were removed from our analysis.

Using NDCs with successful AMP conversions, we then calculated a volume-weighted AMP for each of the corresponding HCPCS codes, consistent with CMS’s methodology for calculating volume-weighted ASPs. When calculating the volume-weighted AMP for a HCPCS code with partial AMP data, we excluded any NDCs without AMPs; however, we did not exclude those NDCs from the corresponding volume-weighted ASP. This means that the volume-weighted AMP for a HCPCS code with partial AMP data is based on fewer NDCs than the volume-weighted ASP for that same code. Appendix C provides a more detailed description of the methods we used to both convert AMPs and calculate volume-weighted AMPs. Table 1 provides the final number of HCPCS codes and NDCs included in our analysis after we removed NDCs with either no AMP data or unsuccessful AMP conversions.

---

23 We did not calculate converted AMPs for NDCs in the third group because those NDCs had no AMP data.

Comparing Second-Quarter 2010 Volume-Weighted ASPs and AMPs for HCPCS Codes With Complete AMP data

For each of the 350 HCPCS codes with complete AMP data, we compared the volume-weighted ASP and AMP and determined whether the ASP for the code exceeded the AMP by at least 5 percent. For HCPCS codes that exceeded the 5-percent threshold, we reviewed the associated NDCs to verify the accuracy of the billing unit information. According to our review, none of the HCPCS codes that exceeded the threshold were associated with questionable billing units. However, we excluded one HCPCS code from our findings because the manufacturer of the corresponding NDC indicated to OIG that the AMP data were not correct.24

For each of the remaining HCPCS codes that exceeded the 5-percent threshold, we estimated the monetary impact of lowering reimbursement to 103 percent of the AMP.25 First, we calculated 103 percent of the volume-weighted AMP and subtracted this amount from the fourth-quarter 2010 reimbursement amount for the HCPCS code. To estimate the financial effect for the fourth quarter of 2010, we then multiplied the difference by one-fourth of the number of services that were allowed by Medicare for each HCPCS code in 2009, as reported in the PBAR.26, 27

We additionally determined whether HCPCS codes with complete AMP data also exceeded the 5-percent threshold in any of the three previous quarters, dating back to the third quarter of 2009. We then totaled the estimated savings for that subset of codes.

---

24 In the course of a previous study (see OEI-03-09-00350), a manufacturer notified us that the AMPs for one of its NDCs were incorrect for all four quarters of 2008. The second-quarter 2010 AMP for that NDC was the same as the fourth-quarter 2008 AMP identified by the manufacturer as incorrect; therefore, we assumed that the second-quarter 2010 AMP was incorrect as well. We will provide the name of this manufacturer to CMS for followup.

25 Section 1847A(d)(3)(C) of the Act directs the Secretary to replace payment amounts for drugs that exceed the 5-percent threshold with the lesser of the widely available market price for the drug (if any) or 103 percent of the AMP. For the purposes of this study, we used 103 percent of the AMP to estimate the impact of lowering reimbursement amounts. If widely available market prices had been available for these drugs and lower than 103 percent of the AMP, the savings estimate presented in this report would have been greater.

26 The PBAR data for 2009 were 98 percent complete when the data were downloaded in March 2010.

27 This estimate assumes that the number of services that were allowed by Medicare in 2009 remained consistent from one quarter to the next and that there were no significant changes in utilization between 2009 and 2010.
Comparing Second-Quarter 2010 Volume-Weighted ASPs and AMPs for HCPCS Codes With Partial AMP data

For each of the 106 HCPCS codes with partial AMP data, we compared the volume-weighted ASP and AMP and determined whether the ASP for the code exceeded the AMP by at least 5 percent. For HCPCS codes that exceeded the 5-percent threshold, we reviewed the associated NDCs to verify the accuracy of the billing units. According to our review, NDCs for two codes had billing unit information in CMS’s crosswalk file that may not have accurately reflected the number of billing units actually contained in the NDC. Because volume-weighted ASPs and AMPs are calculated using this billing unit information, we could not be certain that the results for these two codes were correct. Therefore, we excluded these HCPCS codes from our findings.

For each of the remaining HCPCS codes that exceeded the 5-percent threshold, we determined whether missing AMPs unduly influenced the results of our pricing comparison. As mentioned previously, the volume-weighted AMP for a HCPCS code with partial AMP data is based on fewer NDCs than the volume-weighted ASP for that same code. Therefore, there may be a disparity between the volume-weighted ASP and AMP that would not exist if AMP data were available for the full set of NDCs. In other words, the volume-weighted ASP for the HCPCS code could exceed the volume-weighted AMP by at least 5 percent only because AMPs for certain NDCs were not represented.

CMS has expressed concern that partial AMP data may not adequately reflect market trends. Therefore, to identify HCPCS codes with partial AMP data that exceeded the 5-percent threshold only because AMP data were missing, we reanalyzed pricing data after accounting for the missing values. Specifically, we replaced each missing AMP with its corresponding ASP and recalculated the volume-weighted AMPs using those imputed prices. We then compared those new volume-weighted AMPs to the volume-weighted ASPs originally calculated by CMS.

If a HCPCS code no longer exceeded the 5-percent threshold, we concluded that the missing AMPs were likely responsible for the HCPCS code initially exceeding the threshold, as opposed to an actual disparity between ASPs and AMPs in the marketplace.

If a HCPCS code continued to exceed the 5-percent threshold, we concluded that missing AMPs had little impact on the results of our pricing comparison. These HCPCS codes likely exceeded the threshold as a result of actual pricing differences between ASPs and AMPs. Because price substitutions for these HCPCS codes may be warranted, we estimated the monetary impact of lowering reimbursement to 103 percent of the new volume-weighted AMPs. We also determined whether any of these codes exceeded the threshold in any of the three previous quarters and totaled the estimated savings for that subset of codes.

29 Although an NDC’s ASP is not usually the same as its AMP, it is generally within about 5 percent of the AMP on average. Therefore, we believe that ASP acts as a reasonable proxy for AMP, ensuring that the NDC is represented in both the volume-weighted ASP and the volume-weighted AMP for the HCPCS code.
Limitations
We did not verify the accuracy of manufacturer-reported ASP and AMP data, nor did we verify the underlying methodology used by manufacturers to calculate ASPs and AMPs. Furthermore, we did not verify the accuracy of CMS’s crosswalk files or examine NDCs that CMS opted to exclude from its calculation of Part B drug reimbursement amounts.

Manufacturers are required to submit their quarterly ASP and AMP data to CMS 30 days after the close of the quarter. Our analyses were performed on ASP and AMP data compiled by CMS soon after that deadline. We did not determine whether manufacturers provided additional or revised pricing data to CMS at a later date.

Standards
This study was conducted in accordance with the Quality Standards for Inspection and Evaluation issued by the Council of the Inspectors General on Integrity and Efficiency.

RESULTS

Of the 350 Drug Codes With Complete AMP Data, Volume-Weighted ASPs for 10 Exceeded the Volume-Weighted AMPs by at Least 5 Percent
Consistent with sections 1847A(d)(2)(B) and 1847A(d)(3) of the Act, OIG compared ASPs to AMPs to identify instances in which the ASP for a particular drug exceeded the AMP by a threshold of 5 percent. In the second quarter of 2010, 10 of the 350 HCPCS codes with complete AMP data (3 percent) exceeded this 5-percent threshold. Table 2 describes the extent to which ASPs exceeded AMPs for the 10 HCPCS codes. For two of the codes, the volume-weighted ASP exceeded the volume-weighted AMP by more than 20 percent. A list of all 10 HCPCS codes, including their descriptions and HCPCS dosage amounts, is presented in Appendix D.

Pursuant to sections 1847A(d)(3) of the Act, the Secretary may disregard the ASP for a drug that exceeds the 5-percent threshold and shall substitute the payment amount with the lesser of either the widely available market price or 103 percent of the AMP. If reimbursement amounts for all 10 codes with complete AMP data had been based on 103 percent of the AMPs during the fourth quarter of 2010, we estimate that Medicare expenditures would have been reduced by $713,000 in that quarter alone.\textsuperscript{30, 31}

Over half of the HCPCS codes (6 of 10) also exceeded the 5-percent threshold in at least one of the previous three quarters. If reimbursement amounts for the six codes had been based on 103 percent of the AMPs during the fourth quarter of 2010, Medicare expenditures would have been reduced by an estimated $610,000 in that quarter.\textsuperscript{32} Table 3 presents a list of the six HCPCS codes with complete AMP data that previously exceeded the 5-percent threshold.

Source: OIG analysis of ASP and AMP data from the third quarter of 2009 through the second quarter of 2010. In each quarter, codes exceeded the 5-percent threshold based on complete AMP data.

Of the 106 Drug Codes With Partial AMP Data, Volume-Weighted ASPs for 15 Exceeded the Volume-Weighted AMPs by at Least 5 Percent

In addition to examining HCPCS codes with complete AMP data, we examined 106 HCPCS codes for which only partial AMP data were available. ASPs for 15 of these 106 HCPCS codes (14 percent) exceeded the AMPs by at least 5 percent in the second quarter of 2010. A list of the 15 HCPCS codes, including their descriptions and HCPCS dosage amounts, is presented in Appendix E.

\textsuperscript{30} All savings estimates in this report assume that the number of services that were allowed by Medicare in 2009 remained consistent from one quarter to the next and that there were no significant changes in utilization between 2009 and 2010.

\textsuperscript{31} Of the 10 HCPCS codes that met the 5-percent threshold using complete AMP data, 1 was not listed in the 2009 PBAR file. As a result, this code was not included in the estimated savings for this group.

\textsuperscript{32} Of the six HCPCS codes with complete AMP data that met the 5-percent threshold in multiple quarters, one had no expenditures listed in the 2009 PBAR file. As a result, this code was not included in the estimated savings for this group.
For 5 of the 15 HCPCS codes, missing AMPs likely had little influence on the outcome of the pricing comparisons. Five of the 15 HCPCS codes with partial AMP data continued to exceed the threshold when we accounted for missing AMPs, suggesting that the pricing comparisons for these codes were accurately capturing underlying market trends even though AMP data were not available for the full set of NDCs. Because missing AMPs likely had little influence on the pricing comparison results for these five HCPCS codes, price substitutions may be legitimately warranted in these cases. If reimbursement amounts for the five codes had been based on 103 percent of the AMPs, we estimate that Medicare expenditures would have been reduced by $239,000 during the fourth quarter of 2010.

Table 4 describes the extent to which ASPs exceeded AMPs for the five HCPCS codes. For one of the codes, volume-weighted ASPs exceeded AMPs by more than 20 percent.

</table>

For the remaining 10 of 15 HCPCS codes, ASPs no longer exceeded the AMPs in the second quarter of 2010, indicating that these codes initially exceeded the threshold because of missing AMP data rather than a genuine pricing disparity between the ASPs and AMPs.

Of the five HCPCS codes on which missing AMPs likely had little influence, three exceeded the 5-percent threshold in at least one of the previous three quarters. If reimbursement amounts for the three codes had been substituted with 103 percent of the AMPs, Medicare expenditures would have been reduced by an estimated $11,000 during the fourth quarter of 2010. Table 5 presents a list of the three HCPCS codes with partial AMP data that also exceeded the 5-percent threshold in previous quarters.

Source: OIG analysis of ASP and AMP data from the third quarter of 2009 through the second quarter of 2010.

*This code previously exceeded the 5-percent threshold during the specified quarter based on complete AMP data. For all other quarters, codes exceeded the 5-percent threshold based on partial AMP data.

Pricing Comparisons Could Not Be Performed on 54 Drug Codes Because No AMP Data Were Available

For 54 HCPCS codes, OIG could not compare ASPs and AMPs because there were no AMP data for any of the 236 NDCs that CMS used when calculating drug reimbursement amounts for these codes. In 2009, Medicare allowances for these 54 codes totaled $163 million.\(^{33}\)

Manufacturers for 16 percent of the NDCs without AMP data (38 of 236) participated in the Medicaid drug rebate program as of the second quarter of 2010 and were therefore generally required to submit AMP data for their covered outpatient drugs.\(^{34},^{35},^{36}\) The majority of these 38 NDCs belonged to one manufacturer.

Manufacturers for the remaining 198 of 236 NDCs did not participate in the Medicaid drug rebate program and therefore were not required to submit AMP data.

CONCLUSION

To monitor Medicare reimbursement amounts based on ASPs and consistent with its statutory mandate, OIG compared ASPs and AMPs to identify instances in which the ASP for a particular drug exceeded the AMP by at least 5 percent. This is OIG’s 19\(^{th}\) report comparing ASPs and AMPs, and it examines HCPCS codes with AMP data for every NDC that CMS used to establish reimbursement amounts, as well as HCPCS codes with only partial AMP data.

---

\(^{33}\) Of the 54 HCPCS codes with no associated AMP data, 6 were not listed in the 2009 PBAR file. As a result, these codes were not included in the total Medicare allowances for the year.

\(^{34}\) To determine whether a manufacturer participated in the Medicaid drug rebate program, we consulted CMS’s Drug Company Contact Information, accessed at [http://www.cms.gov](http://www.cms.gov) on October 19, 2010.

\(^{35}\) Although manufacturers with rebate agreements are required to submit AMP data for their covered outpatient drugs, there may be valid reasons why an AMP was not provided for a specific NDC in a given quarter. For example, a manufacturer may not have been required to submit an AMP if the drug product had been terminated and there was no drug utilization during the quarter.

\(^{36}\) These 38 NDCs were crosswalked to 18 HCPCS codes.
We identified a total of 25 HCPCS codes that exceeded the threshold for price adjustment in the second quarter of 2010. Of these 25 HCPCS codes, 10 had complete AMP data (i.e., AMP data for every drug product that CMS used to establish reimbursement amounts). If reimbursement amounts for all 10 codes with complete AMP data had been based on 103 percent of the AMPs during the fourth quarter of 2010, we estimate that Medicare expenditures would have been reduced by $713,000 in that quarter alone. The remaining 15 of 25 HCPCS codes also exceeded the 5-percent threshold in the second quarter of 2010 but did not have AMP data for every drug product that CMS used when calculating reimbursement. For 5 of the 15 codes, price reductions may be legitimately warranted because missing AMPs likely had little influence on the pricing comparison results for these codes. We could not compare ASPs and AMPs for 54 HCPCS codes because AMP data were not submitted for any of the NDCs that CMS used to calculate reimbursement. Manufacturers for 16 percent of these NDCs had Medicaid drug rebate agreements and were therefore generally required to submit AMPs. OIG will continue to work with CMS to evaluate and pursue appropriate actions against those manufacturers that fail to submit required data.

Some of OIG’s previous reports comparing ASPs and AMPs have contained recommendations, which we continue to support. We are not making additional recommendations in this report and, as such, are issuing the report directly in final form. If you have comments or questions about this report, please provide them within 60 days. Please refer to report number OEI-03-11-00030 in all correspondence.

APPENDIX A

The Equation Used by the Centers for Medicare & Medicaid Services To Calculate Volume-Weighted Average Sales Prices on or After April 1, 2008

A volume-weighted average sales price (ASP) is calculated for the dosage amount associated with the Healthcare Common Procedure Coding System (HCPCS) code. In the following equation, the “number of billing units” represents the number of HCPCS code doses that are contained in a national drug code (NDC).

$$\text{Volume-Weighted ASP for Dosage Amount of HCPCS Code} = \frac{\text{Sum of (ASP for NDC} \times \text{Number of NDCs Sold)}}{\text{Sum of (Number of NDCs Sold} \times \text{Number of Billing Units in NDC)}}$$

APPENDIX C

Detailed Methodology for Converting and Volume-Weighting Average Manufacturer Prices for the Second Quarter of 2010

Healthcare Common Procedure Coding System codes with complete average manufacturer price data. Of the 519 Healthcare Common Procedure Coding System (HCPCS) codes with reimbursement amounts based on average sales prices (ASP), 358 had average manufacturer prices (AMP) for every national drug code (NDC) that the Centers for Medicare & Medicaid Services (CMS) used to calculate volume-weighted ASPs. These 358 HCPCS codes represented 1,395 NDCs. For 10 NDCs, we could not successfully identify the amount of the drug reflected by the ASP and therefore could not calculate a converted AMP. These 10 NDCs were crosswalked to 8 HCPCS codes. We did not include these 8 HCPCS codes (42 NDCs) in our final analysis.

Using the converted AMPs for the remaining 1,353 NDCs, we then calculated a volume-weighted AMP for each of the remaining 350 HCPCS codes consistent with CMS’s methodology for calculating volume-weighted ASPs.

HCPCS codes with partial AMP data. There were 107 HCPCS codes with AMP data for only some of the NDCs that CMS used in its calculation of volume-weighted ASPs. These 107 HCPCS codes represented a total of 1,370 NDCs. AMP data were either missing or unavailable for 541 of these NDCs, which were then excluded from our calculation of volume-weighted AMPs.38

We calculated converted AMPs for each of the remaining 829 NDCs. For 8 of the 829 NDCs, we could not successfully identify the amount of the drug reflected by the ASP and therefore could not calculate a converted AMP. We removed these eight NDCs from our analysis.39 As a result, one HCPCS code no longer had any NDCs with AMP data. Therefore, this HCPCS code was removed from our analysis.

Using the converted AMPs for the remaining 821 NDCs, we then calculated a volume-weighted AMP for each of the remaining 106 HCPCS codes consistent with CMS’s methodology for calculating volume-weighted ASPs.

38 Although AMP data for these 541 NDCs were excluded from our calculation of volume-weighted AMPs, the corresponding ASPs were not excluded from the volume-weighted ASPs as determined by CMS. Volume-weighted ASPs remained the same, regardless of the availability of AMP data.

39 Although we removed NDCs with problematic AMP conversions, we did not remove the corresponding HCPCS codes, provided that other NDCs for those drug codes had usable AMP data. This differs from our analysis of HCPCS codes with complete AMP data, in which we removed not only the NDCs with problematic AMP conversions, but also the corresponding HCPCS codes.
HCPCS codes with no AMP data. For 54 HCPCS codes, there were no AMP data for any of the NDCs that CMS used in its calculation of volume-weighted ASPs. These 54 HCPCS codes represented 236 NDCs.
